Report(Interview Opinion, Interview Feelings, Current State of the System, and System Goals.)

Interview Opinion

Inventory Procurement and Reorder System

The interviewee believes that the current inventory and procurement process needs improvement. Managing inventory manually can lead to errors, inaccurate stock records, and delays in ordering products.

The interviewee thinks that the proposed Inventory Procurement and Reorder System will help organize product information, monitor stock quantities, manage suppliers, and simplify the purchasing process.

The interviewee also believes that automatic low-stock notifications and inventory reports will help employees make better decisions and reduce the risk of running out of important products.

Overall, the interviewee has a positive opinion about the proposed system and believes that it will improve inventory management, save time, and increase work efficiency.

Interview Feelings

Inventory Procurement and Reorder System

During the interview, the employee expressed concern about the difficulties of managing inventory manually. The employee felt that recording product quantities and tracking purchase orders could take a lot of time and lead to human errors.

The employee also expressed concern about running out of important products because of delays in identifying low stock levels.

However, the employee showed interest in the proposed Inventory Procurement and Reorder System. The employee felt that automatic notifications, organized supplier information, and clear inventory reports would make daily tasks easier and faster.

Overall, the employee was optimistic about the new system and believed that it could reduce workload, improve accuracy, and make inventory and procurement management more efficient.

Current State of the System

Inventory Procurement and Reorder System

The current inventory and procurement process depends mainly on manual procedures and spreadsheets to manage products, track stock quantities, and handle purchasing activities.

Employees manually record product information and update stock quantities. They also check inventory levels regularly to determine when products need to be reordered.

The current system has several problems:

1. **Manual Inventory Tracking:** Employees update product quantities manually, which can lead to human errors.
2. **Delayed Reordering:** Products may run out of stock because employees do not identify low stock levels early enough.
3. **Limited Supplier Management:** Supplier information may be stored in separate files, making it difficult to access and organize.
4. **Manual Purchase Orders:** Preparing and tracking purchase orders requires additional time and effort.
5. **Limited Reporting:** Generating reports about stock quantities and purchasing activities can be difficult and time-consuming.
6. **Risk of Stock Shortages:** Poor inventory monitoring may result in unavailable products and delays in business operations.
7. **Difficulty Monitoring Purchases:** Tracking order status and expected delivery dates may require employees to contact suppliers manually.

Therefore, the organization needs an improved system to automate inventory monitoring, organize supplier information, manage purchase orders, and provide accurate inventory reports.

System Goals

Inventory Procurement and Reorder System The main goal of the Inventory Procurement and Reorder System is to improve inventory management and simplify the procurement process by reducing manual work and increasing accuracy.

The system aims to achieve the following goals:

1. **Improve Inventory Accuracy:** Maintain accurate and up-to-date records of products and stock quantities.
2. **Automate Reorder Notifications:** Notify employees when product quantities reach their minimum stock levels.
3. **Manage Supplier Information:** Store and organize supplier details in a centralized database.
4. **Manage Purchase Orders:** Allow employees to create, record, and track purchase orders efficiently.
5. **Reduce Human Errors:** Minimize mistakes caused by manual data entry and inventory calculations.
6. **Prevent Stock Shortages:** Help employees identify low-stock products before they run out.
7. **Generate Inventory Reports:** Provide reports showing available products, stock quantities, low-stock items, and purchase orders.
8. **Improve Procurement Efficiency:** Reduce the time and effort required to manage purchasing activities.
9. **Support Decision-Making:** Provide reliable information to help employees make better inventory and purchasing decisions.
10. **Protect System Data:** Restrict access to system functions according to user permissions and protect stored information.

Conclusion

The proposed system aims to make inventory and procurement management faster, easier, and more reliable. By automating stock monitoring, reorder notifications, supplier management, and purchase order tracking, the organization can reduce errors, prevent stock shortages, and improve overall operational efficiency.
